Title

Barry Rawn[1]

[1]Carnegie Mellon University Africa, Kigali, Rwanda

Background

Introduce the research problem and explain why it matters. Keep this section concise and lead with the central motivation. A useful target is 80–120 words. Cite only the most relevant prior work [1, 2].

Objectives

- State the primary research question.
- Identify the population, system, or setting.
- Summarize the expected contribution.

Context photograph, conceptual diagram,
or motivating data visualization

Figure 1: Use vector PDF for diagrams and 300 ppi images for photographs.

Our Solution

Describe the proposed method, intervention, model, or study design. Use a diagram whenever it communicates the workflow more quickly than prose.

Methodology

1. Collect and clean the study data.
2. Train or implement the proposed approach.
3. Evaluate on a participant-held-out test set.

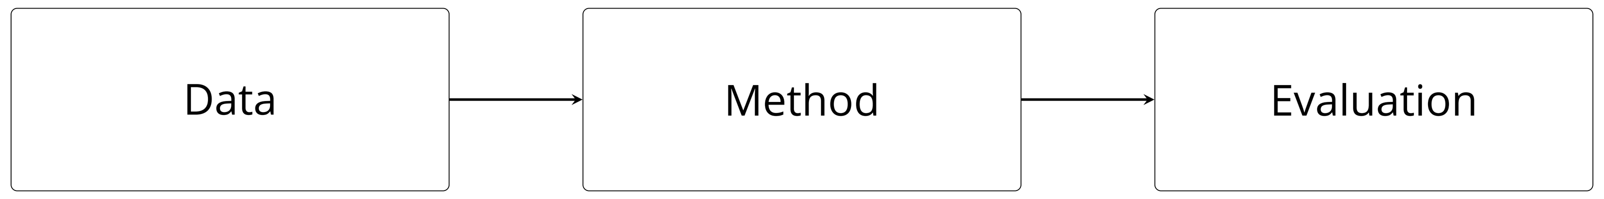

Figure 2: Example workflow. Replace this with the research pipeline.

Mathematical Formulation

Equations can be included directly:

$$\hat{\theta} = \arg\min_{\theta} \frac{1}{n} \sum_{i=1}^{n} \mathcal{L}(f_\theta(x_i), y_i) + \lambda \|\theta\|_2^2.$$

Implementation

Add reproducibility details, hardware, software, ethical approval, or a short data-availability statement here.

Results

Put the most important quantitative or qualitative finding first.

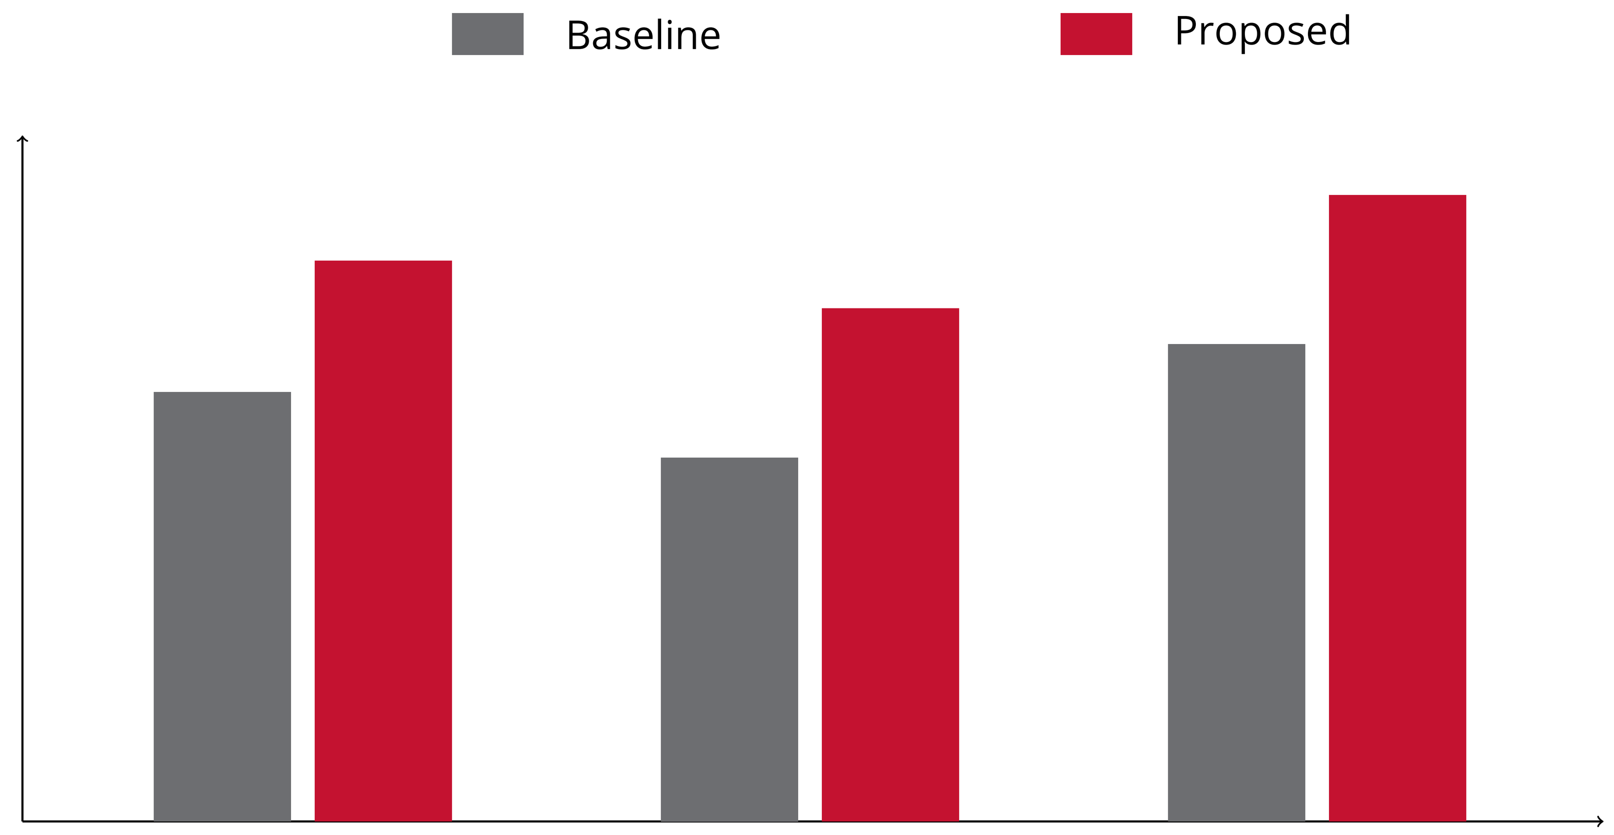

Figure 3: Example result. Report uncertainty and the sample size.

Method	Metric 1	Metric 2
Baseline	0.71	42 ms
Proposed	**0.86**	18 ms

Table 1: Use a small table only when exact values matter.

Future Research

- Validate prospectively in additional settings.
- Evaluate subgroup performance and robustness.
- Study long-term operational outcomes.
